Health concerns of older adults

Here are some things older adults have told us they think about. Maybe some of these things concern you. You may add your concerns in the empty bubbles. Would you like to talk today about the one that matters to you the most? Would you like to make a change in one of them?

Planning for healthy changes

This resource was developed by physicians associated with Ideal Medical Practices at www.idealmedicalpractices.org (written communication by J.H. Wasson, MD, April 2008).

The change I want to make is: (be very specific, what, when, how?)

My goal for the next month is:

How convinced are you that this is the right work for you: A  F  I

0          1          2          3          4          5          6          7          8          9          10
Totally  Unsure  Somewhat  Very  Extremely unconvinced  convinced  convinced  convinced

The steps I will take to reach the goal:
1. ___________________________________________________________________
2. ___________________________________________________________________
3. ___________________________________________________________________

The things that will make it hard to reach the goal:
1. ___________________________________________________________________
2. ___________________________________________________________________
3. ___________________________________________________________________

The ways I can overcome those things that my get in the way:

My confidence that I can reach my goal:

0          1          2          3          4          5          6          7          8          9          10
Not confident at all  Unsure  Somewhat confident  Very confident

Tip: Make your tools friendlier to the elderly population by using a larger text size or an easy-to-read, sans-serif font such as Arial or Verdana.

Visit www.ama-assn.org/go/aging for more information on geriatric health.
Use the 5 A’s—Assess, Advise, Agree, Assist, Arrange—as a framework to guide a conversation about behavior change.

These techniques can be used for patients with chronic conditions or for prevention. Remember, you do not have to touch on every A at every visit; some visits will just use Assess and Advise, and some Assess, Agree and Arrange, etc. Any member of your health care team can learn and use these techniques.

Assess—determine whether your patient is adopting healthier behaviors.

• Use a “bubble diagram” (see “Health concerns of older adults” panel) to elicit your patient’s concerns.

• Use a pre-visit or waiting room questionnaire to focus the examination. Visit www.howyourhealth.com to view examples.

• Ask your patient questions that focus on health behaviors.

  “Most of the patients I work with have trouble [taking medications regularly, living with pain, etc.]. What trouble are you having?”

  “Of all that I have asked you to do, what is the hardest?”

  “Is there anything you have been thinking about doing to improve your health? Have you tried anything?”

  “How important on a scale of 1 to 10 is it for you to [quit smoking, control your blood sugar, lose weight, exercise more, etc.]?” “Why is it a 4 and not a 1?”

Try to get your patient to tell you why change is good for him or her.

Advise—provide brief information without medical jargon.

• Find out what your patient understands about his or her illness or treatment before you give advice. This will save you from repeating what your patient already knows and allow you to clarify his or her misunderstandings.

• Have a key message for each diagnosis or symptom.

• Make the source of the advice (medical literature, your opinion, other patients you work with) clear.

• Ask your patient to repeat what you told him or her so you know if you made your advice understandable. (“Closing the loop” is a proven technique to improve health literacy.)

Agree—collaborate to develop a specific, actionable plan that describes:

• What. Identify the specific tasks your patient will perform before your next meeting.

• When. Designate a specific time when your patient will perform tasks.

• How often. Specify how often your patient should do the task, keeping in mind what suits and what is realistic for his or her lifestyle.

• Where. Designate a specific location where your patient’s will carry out tasks.

• Which problems. Help your patient identify and problem-solve through barriers to carrying out plans.

• Check your patient’s level of confidence in his or her ability to actually make changes.

  “On a scale of 1 to 10, how confident are you that you can [walk three times this week, do relaxation exercises five evenings a week, skip dessert]?”

  Schedule a check-in date by e-mail, phone or another office visit.

Assist—help your patients when they have problems until they learn to help themselves.

• Teach basic problem-solving skills. (Identify the problem, brainstorm solutions, pick one, try it, pick another, try it, find a resource, consider that the problem isn’t solvable now.)

• Refer your patient to a problem-solving Web site such as www.howyourhealth.com for further tips.

Arrange—follow up to check on progress or match the patient to community resources.

• Use phone, e-mail or office staff your patient is familiar with to follow up on plans.

• Keep a list of helpful resources, such as local community agencies, exercise programs, weight loss programs and caregiver support groups.

• Document referrals and recommendations.

1. Elicit patient preferences/desires for behavior change.

   “Is there anything you would like to do for your health over the next few days (weeks) before I see you again?”

   • What?

   • Where?

   • When?

   • How often?

   • Elicit commitment statement (e.g., “I will walk for 20 minutes, in my neighborhood, every Monday, Wednesday and Friday before dinner.”)

2. Check confidence level.

   “That sounds like a great plan. But changing behavior and sticking with a plan is actually very hard for most of us. If you consider a confidence scale of 1 to 10, where ‘10’ means you are very confident you will carry out the plan and ‘1’ means you are not at all confident, how confident are you?”

   If confidence level is less than 7, then problem-solve to identify solutions.

   “That’s great that you feel a confidence level of 5. That’s a lot higher than 1. I wonder if there are some ways we could modify the plan so you might get to a confidence level of 7 or greater. Perhaps you could choose a less ambitious goal, ask for help from a friend or family member, or think of something else that might help you feel more confident about carrying out the plan?”

3. Arrange follow-up.

   “Great, then let’s make a date for our next appointment, so we can check on how you’re doing with your plan.”
